TITLE:

Cosmetic compsn. for attenuating skin defects while

forming translucid layer - comprises dispersion, in fatty

binder, of filler comprising mainly spherical or

spheroidal particles.

DERWENT CLASS:

D21

BASIC ABSTRACT:

502769 A UPAB: 19931113 EΡ

A cosmetic compsn. capable for reducing the defects of the skin (e.g, colouration differences, microreliefs) while leaving on the latter a translucid layer, comprises a dispersion, in a fatty binder, of a filler comprising solid particles of a skin-compatible material. The filler contains at least 50 wt. %, or at 75 vol. %, w.r.t. the total filler, of spherical or spheroidal particles (I) of 0.5-50 microns in size, has an oil absorption such that its vol. concn. (c1), when the vol. of the binder is equal to that of oil absorption (measured on the non volatile fraction of the binder), is 3-90%, and the vol. concn. of the filler (c), in the dispersion, is at least (c1), measured on the nonvolatile fraction of the binder i.e., without taking into account the volatile oils which may be present in the fatty binder.

The filler pref. contains at least 75 (esp. at least 85) wt. % or at least 80 (esp. at least 90) vol. % of (I) w.r.t. total filler. (I) has a sizing 0.5-25 microns, esp. 1-15 microns. (C1) is 4-80% and ratio of (c) to (c1) is at least 1 pref. at least 1.1; this ratio is sufficiently high that the light transmission (measured between 2 quartz blades on an optical path of 100 microns), of the dispersion (contg. all the ingredients except the opt. present volatile oils) in at least 5% at a wavelength of 560nm
